

Installation on Debian

Build dependencies

Quite a list, still it's not comprehensive.

```
sudo apt-get install fakeroot debhelper dpatch libcap-dev pkg-config \  
libspandsp-dev libssl-dev libsndfile1-dev libpq-dev libmysqlclient15-dev \  
libspeex-dev libcurl3-dev unixodbc-dev libcapi20-dev zaptel-source \  
libreadline-dev autoconf automake sox doxygen libtool zaptel-source
```

Compilation

I used [script from wiki to create Debian packages](#) which was slightly modified into [make-callweaver-deb.sh](#) to support latest versions.

There is also minor fix [callweaver-debian-fix.diff](#) to create correct .deb package, adding missing shared library.
