It seemed easy enough... I want to extract `irc-logger.pl` from my perl repository into it's own, so that I can make some refactoring. Easy enough, right?

```
svnadmin create irc-logger
svn mkdir -m "create trunk" file:///home/dpavlin/private/svn/irc-logger/trunk/
svnadmin dump perl | svndumpfilter include --drop-empty-revs trunk/irc-logger.pl | svnadmin load
```

Strange things I noticed:

I have to create directories needed to restore filtered dump manually, `svndumpfilter` could be clever about that, but it isn't (at least it **has** non-default option `--drop-empty-revs` which should also be default, but isn't)
